

Web Access Management

Intro FAQ

What is Web Access Management?

Web Access Management is Admin By Request's new solution for controlling what your users can browse and download at work. It gives IT and security teams a straightforward way to enforce internet access policies across every endpoint in the organization, without getting in the way of legitimate work.

Why does my organization need this?

Most security tools focus on what's already inside your network. Web Access Management addresses a gap that's easy to overlook: what employees are pulling in from outside it. Uncontrolled browsing and unchecked file downloads are two of the most common entry points for malware, shadow IT, and compliance risk. Web Access Management gives you visibility and control over both.

How is this different from a standard web filter?

Web Access Management goes beyond simple URL blocking. Rather than a blunt allow/deny model, it supports approval workflows, user accountability, and intelligent automation so you can maintain control without creating friction for users who have legitimate needs. You can choose to allow users to browse and download freely while restricting files from executing, browse without downloading, or restrict browsing to approved sites only.

It's built around the same philosophy as Admin By Request's existing products: stay in control without slowing people down.

Who is Web Access Management designed for?

Web Access Management is designed for IT administrators and security teams who need to manage internet access at scale, particularly in environments with compliance requirements, shared devices, or a high risk of shadow IT. It fits naturally alongside Admin By Request's Endpoint Privilege Management solution.

Does this replace our existing EPM setup?

No. Web Access Management is a companion product. EPM handles privilege elevation on the endpoint; Web Access Management extends that control to what users access and download via the browser. Together, they cover more of the attack surface from a single platform.

When will Web Access Management be available?

Web Access Management is coming soon. If you'd like to be among the first to know when it launches, contact us at marketing@adminbyrequest.com to sign up for our Product Update email, or follow [Admin By Request](#) on LinkedIn.
